CSS gives us a nice way to insert line breaks into HTML with `page-break-before` and `page-break-after`.

Here's a pretty self explanatory example below. Looks normal in the browser, but when you print the HTML, line breaks are there.

```
<html>
<head></head>
<body>
This is the first page
<br style="page-break-before:always;">
This is the second page
<br style="page-break-after:always;">
This is the last page
</body>
</html>
```
