

CF Loop Bug

I've seen this numerous times throughout the years but I've never actually written it down.

When you do a CFLOOP within a query loop, odd things occasionally happen.

For example:

```
<cfoutput query="getWidgets">
<select name="whatever">
<cfloop query="getThings">
    <option value="#getThings.ID#" <cfif getThingsID EQ getWidgets.ThingID>selected </cfif>
>#getThings.Name#</option>
</cfloop>
</select>
</cfoutput>
```

The value for getWidgets.ThingID will be lost!

So you have to patch it up like so:

```
<cfoutput query="getWidgets">
<select name="whatever">

<!--- This line will fix the problem --->
<cfset foo = getWidgets.thingID>

<cfloop query="getThings">
    <option value="#getThings.ID#" <cfif getThingsID EQ foo>selected </cfif>>#getThings.Name#
</option>
</cfloop>
</select>
</cfoutput>
```

This happens in pretty much all versions of CF I've tested on, including v7.

I don't think this happens EVERY time, just in certain situations. Irritating? Hell yeah.
